

Caesar III clone — Economy flows

v0.13 — supply chains, terrain features, wages

Page 2 — Food chain

farm → wheat → windmill → flour → bakery → food. Plus subsistence food directly from the farm. House / market / tavern consume.

Page 3 — Lumber + heavy industry

lumber mill → wood → sawmill → planks (for villas + civic). Quarry → stone → stonemason → stone_blocks. Mine → iron → factory / weapon smith. v0.13: extractors gate on terrain features.

Page 4 — Luxury chains

Olive farm → olive press → oil (tier 3 gate). Vineyard → wine press → wine (tavern input). Clay pit → pottery shop → pottery (tier 4 gate).

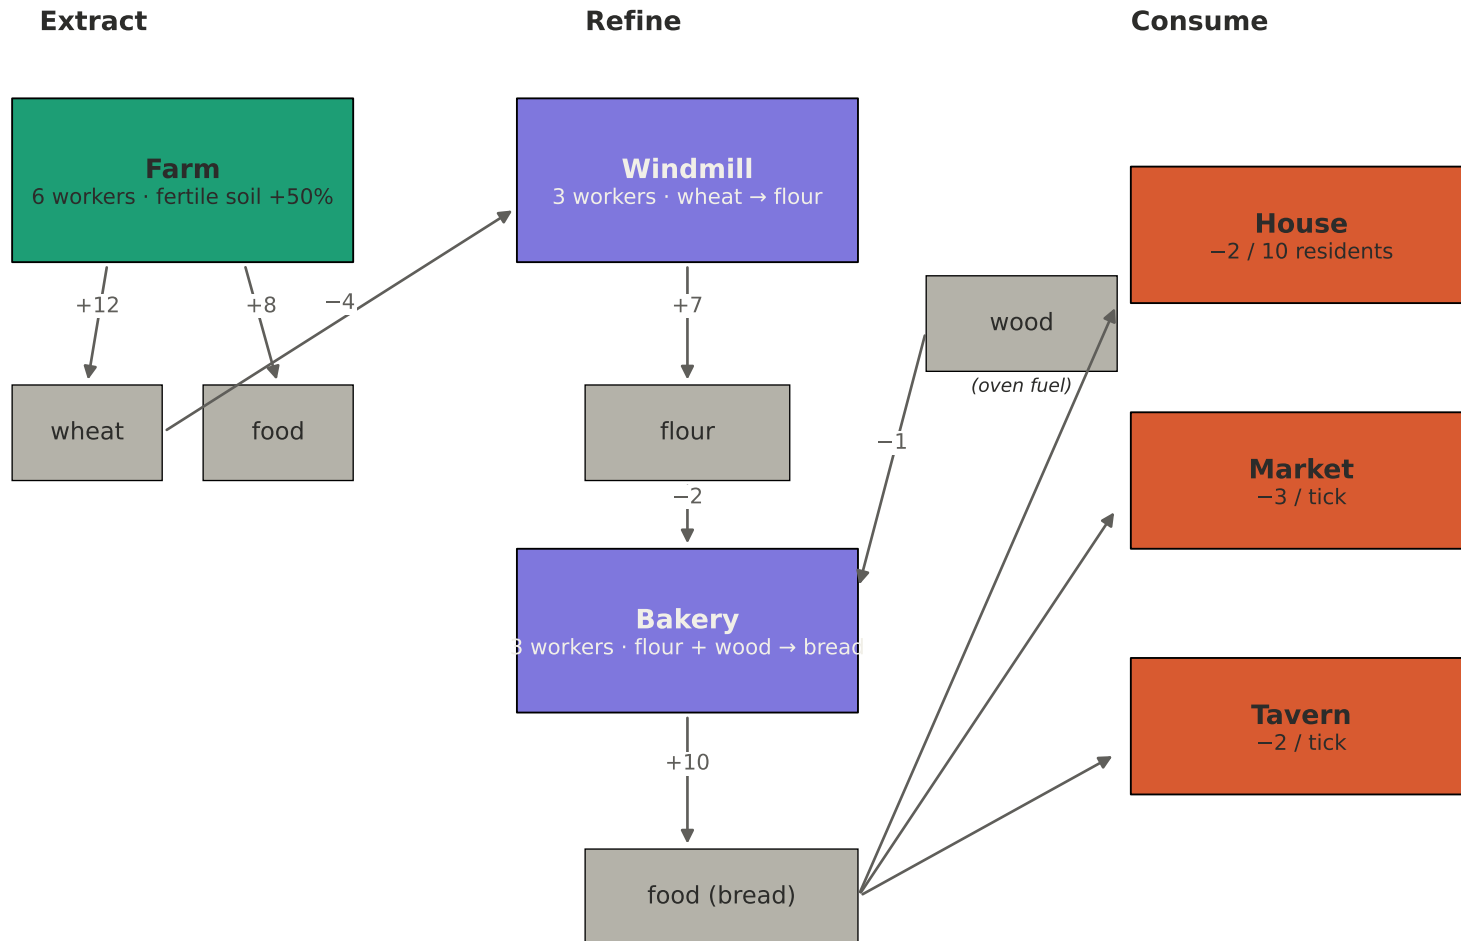

Page 5 — Activity status states

Each building is classified each tick: active, partial, disconnected, unstaffed, starved, or idle. Status drives the inspector display and gates production / consumption.

Numbers on arrows are units/tick at full activity.

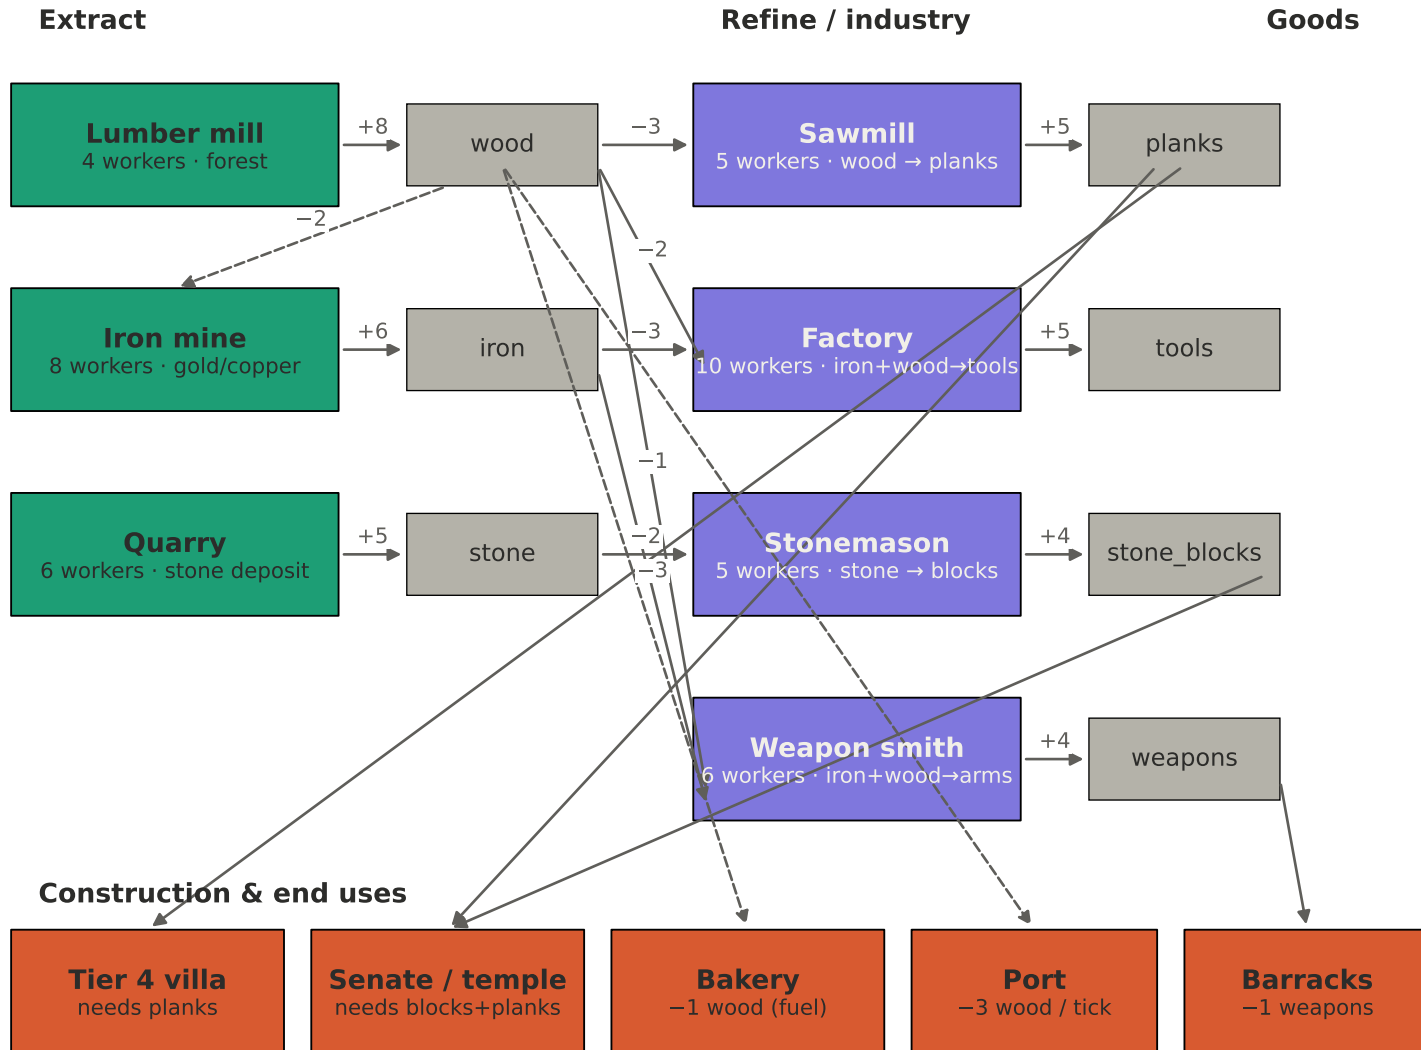

Building colors: teal = extractor, purple = refiner, coral = consumer, gray = resource pool.

Food chain — extraction → refining → consumption

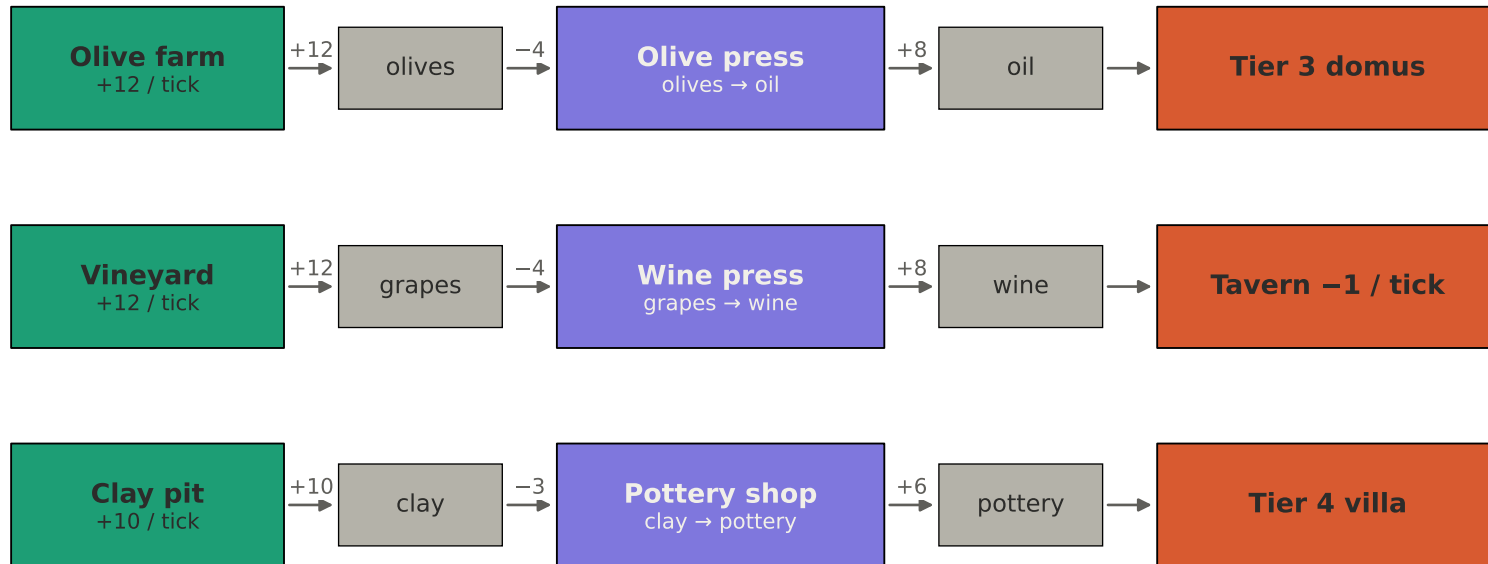

Numbers on arrows = units / tick at full activity. 1 farm + 1 windmill + 1 bakery feeds ~90 citizens (8 from farm + 10 from bakery, ÷ 0.2 / citizen).

Lumber + heavy industry — extractors, refiners, end uses

Solid arrow = chain output flow. Dashed = legacy raw-wood consumer (factory/weapon-smith/bakery still draw wood directly; sawmill is the new preferred consumer).

Luxury chains — olives, wine, pottery

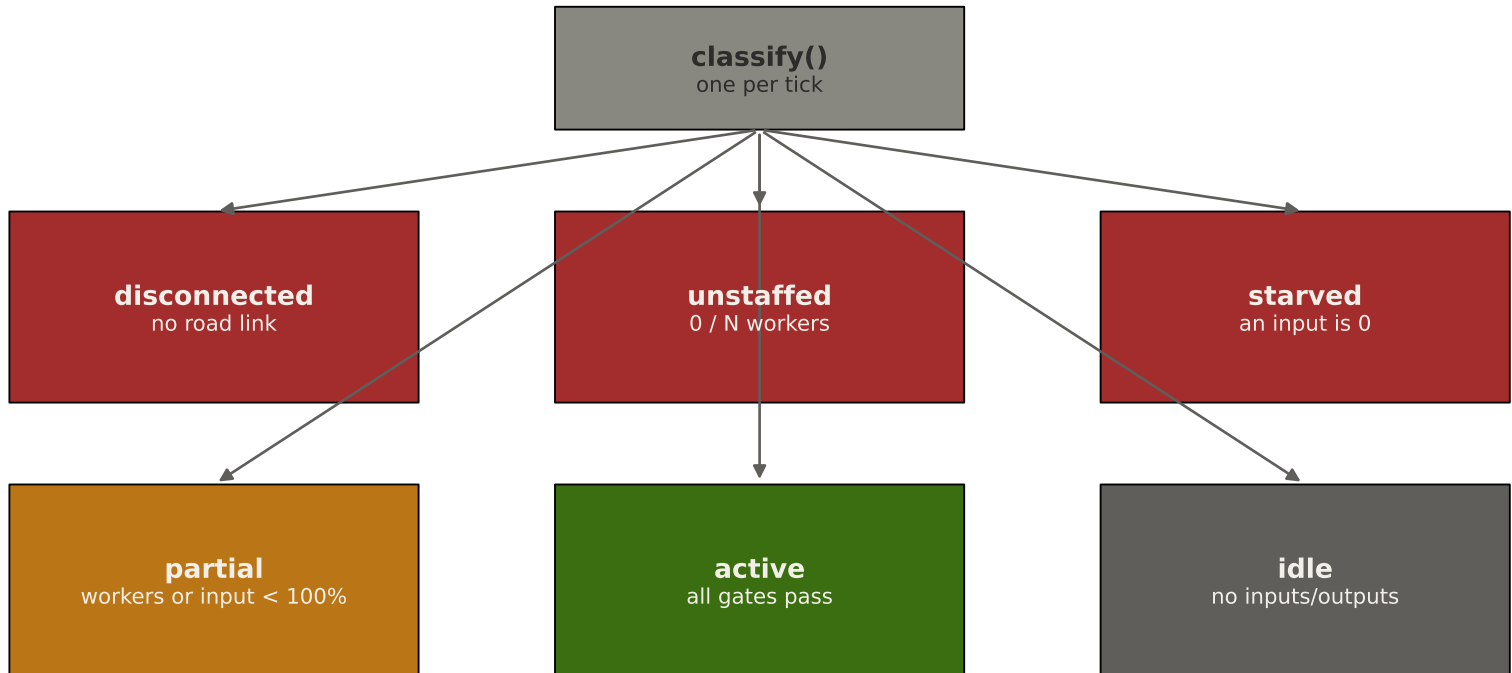

(villa also needs oil)

House tier gating: tier 3 domus needs oil; tier 4 villa needs oil + pottery + planks. Wine is non-gating but the tavern stops producing happiness without it (v0.12 starvation rule).

Tier 3 ratio: 1 olive farm → 3 olive presses ($12 \div 4$); 1 olive press serves enough oil for ~8 villa-blocks via one market walker.

Per-building activity status (v0.12 + v0.13)

Each building is classified once per tick. Throttle multiplies production AND consumption.

throttle = min(workers_filled / workers_needed, min over inputs of supply_ratio)

v0.12 added input-starvation gating: a tavern with no wine produces zero happiness AND drinks no food. v0.13 adds wage gating on top:

if last tick's wage bill couldn't be paid, the global worker pool is reduced proportionally — buildings cascade through partial → unstaffed until the player raises taxes or demolishes idle staff. Wage rate: 0.2 dn / worker / tick (balance.wage_per_worker).
